LED solutions

LED emergency lighting system
The complete solution

TRIDONIC
All over the world, Tridonic is a synonym for excellent products and services associated with perfect light. The company is impressive with a clearly arranged portfolio that will meet any requirement.

With LED modules/LED drivers and lighting management as core competencies – and with a view to the integration of emergency lighting, we are the right partner for electronic component solutions and systems.
A system is only as good as the weakest link of its chain. This is why we consider emergency lighting as a functional unity – from power supply to battery, from optimal use of the light source to easy integration into the lighting management and building management systems.
Power supply for emergency purposes
Various systems are eligible to supply emergency lighting installations with electricity in case of a power failure: separate battery, group battery, central battery, power generators or high-security mains.

Whether you opt for emergency lighting with decentralised separate battery solutions or for a group or central battery installation – with Tridonic components you will always be on the safe side. The comprehensive range comprises both LED Driver for group and central battery supply and single battery-supplied emergency lighting units.
Safety lighting
Safety lighting must provide for a minimum brightness level to avoid panic in buildings and to allow for hazardous procedures to be completed and equipment to be turned off safely. Escape routes and safety devices must be clearly recognisable, thus enabling people to leave the premises quickly. Safety lighting breaks down into anti-panic lighting, escape route lighting and safety lighting for high-risk workplaces.

Secondary lighting
Secondary lighting provides light in places where power failures will not cause any hazard, but where nevertheless work needs to be continued. For a limited period of time, it will assume the function of general lighting.

Anti-panic lighting
Anti-panic lighting is meant to avoid panic in case of a power failure and to enable the people in the building to clearly recognise escape routes. The required illuminance level in the defined area is at least 0.5 lux.

Escape route lighting
Escape route lighting allows for safety devices to be recognised clearly and used safely. Escape routes must be illuminated across a width of 2 m. In doing so, an illuminance level of at least 1 lux along the center line for a path width of one metre must be guaranteed.

According to the EN 1838 standard, the ratio of highest to lowest illuminance must not exceed 40:1 for anti-panic and escape route lighting. The required illuminance level must be reached after no longer than 60 seconds. 50 per cent of the illuminance level, however, must be reached already after 5 seconds. The rated service time is at least one hour.

Emergency lighting for high-risk workplaces
Emergency lighting for high-risk workplaces must reach 10 per cent of the illuminance level required for the respective tasks or at least 15 lux after a maximum switch-on delay of 0.5 seconds. The ratio between highest and lowest illuminance must not exceed 10:1.

LED emergency lighting system
With good reason
Emergency lighting protects people against panic and accidents

With our products and our experience you are on the safe side
Light enables people to leave buildings safely, helps them to find their way round and reduces accident hazards. Accordingly, various national and international standards, regulations and directives govern the operator’s responsibility for reliable operation of the respective installations. What is required here is regular testing and function monitoring.

Three ranges:
**BASIC, SELFTEST and PRO**
For the function test of the emergency lighting installation, Tridonic disposes of a ballast solution that is adequate both in economic and functional terms for each individual application – from manual testing of individual installations in the BASIC range, via integrated automatic test functions (SELFTEST range) through to central monitoring of the entire emergency lighting system in the PRO range.

Tridonic emergency lighting LED driver with automatic test functions meet various testing and inspection algorithms according to the IEC 62034 standard. In the process, a random generator controls the start of the test cycles, thus preventing all batteries from being discharged at the same time and avoiding potential safety gaps. To ensure the right moment for running the annual system test, the switching status of the luminaires is permanently monitored. Based on this information, the annual system test can automatically be run at times when the rooms are not in use.

**Emergency lighting management**
Owing to the DALI communication standard, Tridonic emergency lighting components of the PRO range can easily be integrated into a monitored lighting and emergency lighting system. Additionally, Tridonic complements the general benefits of a DALI system through special highlights, such as the patented easy addressing system and scalable control systems – from the compact control unit through to the PC software.
They are ideal for impressively efficient, and at the same time simple, emergency lighting solutions. Future-oriented solutions with perfectly matched components are generated from the combination of Tridonic's many years of experience in the field of LED Driver and the company's innovative LED light sources.

**EM powerLED emergency lighting control unit + LED emergency lighting modules**

LEDs are ideally suited for use in escape sign, escape route and anti-panic luminaires. In this field, Tridonic offers a wide range of LED modules for emergency lighting operation that boast impressively high system efficiency. Optics that are optimised for the respective application guarantee high illuminance levels combined with extremely compact dimensions.
**Emergency light with system**
Solutions with separate integrated emergency lighting LED

---

**LED driver**
for general lighting

*e.g. Driver LCA*

---

**Emergency lighting LED driver**

*e.g. EM powerLED 4 W*

---

**Combined LED module for general + emergency lighting**

*e.g. Module QLE EM*

---

**EM powerLED emergency lighting LED driver + combined LED modules for general and emergency lighting**

For use in luminaires for general lighting, Tridonic can provide you with a wide range of LED modules. The modules of the EM range feature defined LED light points for emergency lighting operation – and accordingly an integrated emergency lighting function.

As these LEDs are addressed separately, reliability is increased even further, and ageing effects avoided. Direct integration also reduces wiring effort.
EM converterLED emergency lighting LED driver + LED modules for general lighting
In the universal system, the LED modules that are also used for general lighting are switched by means of the emergency lighting control gear in case of an emergency.

This solution offers maximum flexibility: it is compatible with all LED modules and all LED gear components made by Tridonic and other manufacturers.
Emergency light with system
Combined solution for normal and emergency lighting operation

**Combined emergency lighting LED driver**
- EM powerLED PRO DIM 45W SR

**LED modules for general lighting**
- e.g. Module ELA

**EM powerLED emergency lighting control units for higher LED-power + LED modules for general lighting**
The combined emergency lighting LED driver EM powerLED (80 W lp, 50 W/45 W C, SR) LED emergency lighting control units are the ideal solutions for a cost-optimised structure of the emergency lighting installation. They integrate the LED driver for mains operation (four channels) and the emergency lighting function (one channel) in one assembly.
LED emergency lighting system

**Emergency light with system**
LED light engine for emergency lighting operation maintained and non-maintained

**LED Light Engine EM ready2apply**
The EM ready2apply complete solution (BASIC, SELFTEST, PRO) is the ideal solution for simple emergency lighting design. Thanks to the fusion of the LED driver and the LED module in combination with a long-lasting lithium-iron phosphate (LiFePO₄) battery, the unit is immediately ready for use.

**Surface-mounted luminaire EM ready2apply LiFePO₄**
This surface-mounted luminaire impresses both with its technical excellence and its space-saving design. To meet a variety of wiring requirements, two rear panels at different height are available for mounting the luminaire, without any need for tools. Both variants are suitable for various field applications, such as BESA installation. The battery in the cover can also be easily replaced in just a few steps.
Tridonic offers a diverse range of complete emergency lighting solutions for separate battery-supplied emergency lighting installations – for different requirements and LED modules – that perfectly match the requirements of the various country-specific standards.

Here you will find both entirely straightforward and highly sophisticated solutions. The range extends from cost-optimised through to high-end emergency lighting systems.

The specifications of the individual products are available at www.tridonic.com/emergency.
LED emergency lighting system

EM powerLED high power
LED driver for general and emergency lighting

The EM powerLED high power range of combined units is the smart solution where cost optimised or feature driven emergency lighting is required. It integrates the LED driver for mains operation and emergency lighting into one unit. Drivers are available for all applications from low profile non-SELV units for use in linear and square luminaires to compact SELV units for use with downlights and decorative luminaires. Versions are available to cover Basic testing, Self-testing and DALI addressable and monitored testing installations.

The innovative PRO compact versions are true one for all products allowing lighting control and dimming alongside emergency testing with a single DALI address. The units are fully compatible with the main PREMIUM and EXCITE range of Tridonic mains LED Drivers and can be used seamlessly in any installation. Strain relief SR compact versions in conjunction with plug in remote battery offer an out of the box solution.

EM powerLED SELFTEST FX 45 W
Independent automatic self-testing
EM powerLED SELFTEST with its integrated automatic test functions is performing a weekly function test and an annual duration test independently. The test result is shown locally via a bi-colour status display LED.

EM powerLED PRO DIM 45 W
Central control and monitoring via DALI
The DALI addressable EM powerLED PRO combines both lighting control and automatic tested and monitored emergency lighting in one product.

EM powerLED BASIC FX SC LiFePO4 32 W
The combined emergency lighting LED driver is very compact and reduces wiring work.

At a glance:
EM powerLED high power

- Combined functionality
- Small range for maximum coverage including selection of duration and power output
- Compact SELV and linear* non-SELV units
- Strain relief and embodiment versions of SELV units
- Basic, self-testing and PRO DALI versions
- Integrated simple corridorFUNCTION for BASIC versions
- ST versions with switchDIM
- PRO versions with a single DALI address for emergency and lighting control
- I-SELECT 2 for easy and accurate current selection

* Only currently available in BASIC test versions.
EM powerLED low power
LED driver for a wide range of applications

The characteristic features of Tridonic emergency lighting LED Driver are small dimensions and extremely flexible applications. Apart from the operation of powerful individual LED light points, they are also able to actuate several LED points with a lower individual rating. The entire range of Emergency lighting LED Driver has been designed for operation with environmentally friendly NiMH batteries.

The unique intelligent multi-level charging circuit provides for quick and gentle charging of the batteries. EM powerLED 1 W and 2 W may be used in maintained mode and in non-maintained mode. They are accordingly suited for both maintained operation in escape sign luminaires or for minimum lighting at night as well as in safety luminaires with a low to medium rating. EM powerLED is available with 1, 2 and 4 W.

EM powerLED BASIC 1–4 W
Compact and efficient
EM powerLED BASIC 1–4 W is a high-grade emergency lighting control unit offering maximum reliability for the operation of 1 to 2 LEDs in a row within minimum space (cross-section of 21 × 30 mm).

EM powerLED SELFTEST 1–4 W
Automatic testing and monitoring
The DALI-2 certified emergency lighting driver operates independently, carries out all function and operation tests and automatically checks the batteries. The results can be read from the two-colour status LED. The EM powerLED supports modern LiFePO₄ batteries and is ideal for long-life lighting solutions.

EM powerLED PRO 1–4 W
Integration into a DALI system
The high-end EM powerLED PRO 1-4W product with lumDATA and DALI-2 certification is designed for LiFePO₄ batteries and features unrestricted DALI compatibility and a number of impressive performance characteristics. These include the patented addressing system (EZ-Addressing), which makes addressing DALI emergency LED drivers a simple task in any installation.

EM powerLED BASIC SC 32 W
Small housing for approved battery
The combined emergency lighting driver for self testing is a space-saving version for NiCd and NiMH batteries and can either be built into the luminaire or used as an independent device. It is designed for a forward voltage of 15 to 50 volts and supports a maximum output power of 32 watts. The driver is also available with an IP20-protected battery pack. I-SELECT 2 plugs can be used to adjust the output current between 350 and 700 mA.

At a glance EM powerLED
- Basic, SELFTEST and DALI-addressable versions
- Compact design with 1, 2 or 4 W output power
- Combined unit for mains and emergency lighting operation
- Maintained and non-maintained mode
- Various mounting options
The rapid growth of LED technology within the lighting sector has created need for suitable emergency lighting systems for luminaires. Thanks to power control in emergency operation, the slim, transparent range of the EM converterLED product group offers most flexibility for a number of combinations of LED light sources with LED Drivers by Tridonic and other renowned manufacturers.

As a LED driver for non-maintained mode, EM converterLED is used in combination with standard and dimmable LED drivers. It is available as SELV and non-SELV versions and with different functions. According to SELV classification, versions with a maximum output voltage of 50 V, 90 V and 250 V are available.

At a glance: EM converterLED
- Can be combined with dimmable and non-dimmable LED Drivers for maintained operation
- Can be used flexibly in combination with LED modules by Tridonic or other renowned manufacturers
- Basic, Selftest and DALI-addressable versions
- For medium to high LED performance
- Constant current operation for constant lighting result
- SELV and non-SELV versions

The latest EM converterLED product range now also supports LiFePO4 batteries

The entire EM converterLED group supports both commonly used NiCd and NiMH batteries and the latest generation of LiFePO4-based batteries. These products have a much longer life time of up to 100,000 hours, an 8-year guarantee and are environmentally friendly. Their high energy density enables smaller batteries, and subsequently more compact luminaire designs.
LED emergency lighting system

EM converterLED
Highly compatible emergency LED driver

One housing format for all
The housing concept for the EM converterLED range with fixed dimensions for length, width and height (179 × 30 × 21 mm) provides luminaire manufacturers with the possibility to scale and extend their luminaire ranges with different emergency lighting functions, without having to change the mechanical design and holes of their luminaires.

Overview

<td>Local monitoring</td>
<td>Central monitoring via DALI</td>
</tr>
</tbody>
</table>

EM converterLED BASIC offers fundamental emergency lighting functions for cost-optimised emergency lighting solutions. National test standards for emergency lighting applications are implemented manually; test results must be manually documented.

EM converterLED SELFTEST features a decentralised selftest function in compliance with national standards for emergency lighting applications. Typically, the test results will be displayed at the luminaire by means of a two-coloured LED; the results are documented manually.

EM converterLED PRO features a selftest function in compliance with national standards. The test procedures and test sequences as well as the documentation of test results are managed through a central DALI system. The NFC interface allows the emergency lighting drivers to be easily commissioned and the black box data to be read out via companionSUITE. Also integrated is the DALI power supply, which paves the way for wireless emergency functionality, in a compact luminaire design.

EM converterPACK
Driver and battery combined

The EM converterPACK combines emergency lighting driver and battery in one housing. Existing luminaires can therefore easily be equipped for emergency lighting mode – without the need for a combo device or special driver. The housing with strain relief is easily mounted via a plug-in system and offers the option of loop-through wiring. In the practical EM converterPACK box, driver and battery combinations can also be installed outside the luminaire.

EM converterPACK ST/PRO
Practical remote solution

The EM converterPACK with emergency lighting driver and battery enables downlights and Edgelit panels for emergency lighting to be retrofitted in just a few steps. The remote solution is available in either SELFTEST or PRO versions.

EM converterLED 6W/9W BASIC/PRO HP
For high-bay applications

The driver variant with 6 or 9 watts was specially developed for high installation heights or applications with high emergency lighting power requirements. They are optionally available for manual testing or with automatic test function and are powered by long-life LiFePO4 batteries.
As compared to fluorescent luminaires, LEDs boast high system efficiency – even at low ambient temperatures. They can be switched on and off as often as necessary, immediately producing full light output. These are ideal conditions for emergency lighting systems with their regular tests and monitoring routines. Due to its compact size, the environmentally friendly LED also offers more flexibility.

Module EM-ES for uniform illumination of escape signs.

At a glance: **Module emergency**

- LED modules for anti-panic and escape route luminaires
- LED of the latest generation
- Long service life thanks to optimal thermal management
- Low energy consumption
- Easy installation in luminaires and housings
- Wide range of applications

Module EMERGENCY (EM) feature an optic ideally matched to the respective application. In spite of its extremely compact size and highly energy-efficient operation, it thus guarantees illumination in conformity with applicable standards.

**Module EM-ES**
**For escape sign luminaires**

For uniform illumination of exit signs or escape signs, Tridonic offers convenient LED strips that make an excellent contribution to safety energy consumption of only 1W for over 50,000 hours. Different models are available for the various luminaires, with the length and number of LEDs varying. EM powerLED Emergency lighting LED Driver provide for reliable low power operation.
The SLE, QLE EM, CLE EM and LLE EM modules are modules for general general lighting, which have additional, separate LEDs for the emergency emergency lighting function.

These can be switched on and off independently of the DALI independently of the other LEDs for orientation and emergency lighting.

Module SLE
LED modules of the latest generation
Due to the circular, compact design with powerful lumen packages, the Module SLE product range opens up a new dimension of flexibility.

The reliable LED module is suitable both for downlights and for spotlights with uniform light distribution. In interiors, colour temperatures of 3,000 K and 4,000 K as well as a colour rendering index CRI > 80 enhance lighting quality, while in outdoor areas the versions with 5,000 K and a CRI > 70 are particularly impressive on account of their high efficiency.

Module CLE EM, QLE EM and LLE EM
Flexible LED system solutions
By combining the octagonal, square and linear LED modules at will, it is very simple to integrate efficient LED technology into existing luminaire designs. At the same time, new design concepts can be implemented – regardless of the optic fitted, for LED system solutions are suitable for all systems, from wide-area luminaires to recessed luminaires. With their high colour rendering, warm white and intermediate colour temperatures, they are an equivalent alternative, in terms of quality, to traditional fluorescent lamps. Another positive feature is their energy balance: excellent system efficiency of up to 155 lumens per watt results from the high energy efficiency of the LED modules and the perfectly matching LED Drivers. For emergency lighting operation, the respective emergency version of these modules is fitted with separate LED light points.

At a glance: LED modules with emergency lighting LEDs
- Minimum ageing of the emergency lighting LEDs
- Increased reliability
- Hardly any impact on normal lighting during function tests
- Easy wiring and full compatibility
- Independent from voltage and output of the main LEDs
The proper function of an emergency lighting installation not only depends on reliable control gear – but, to a great extent, on the quality of the batteries used.

For the wide range of emergency lighting LED Driver, all three NiCd, the more environmentally friendly NiMH and the long lasting LiFePO₄ batteries are offered. The charge controllers of these compatible devices were designed specifically for both technologies either with electronically regulated charging circuits or with the latest multi-level charge controllers to guarantee the least possible energy consumption combined with optimal battery service life.

At a glance: batteries by Tridonic

- High-grade batteries made by internationally renowned manufacturers
- High-temperature cells with long service life according to the latest battery technology
- NiCd for optimal efficiency
- NiMH for good energy density and small dimensions
- LiFePO₄ for long lifetimes and even further reduced dimensions
LED emergency lighting system

**EM ready2apply**

Everything an emergency escape lighting system needs

The EM ready2apply product family combines all the emergency escape lighting components in a compact space. Both the downlight and the surface-mounted variant are fitted with three interchangeable optics. EM ready2apply offers a perfectly coordinated complete solution that is equipped for any area of application in emergency lighting. As the gaps between the LED engines can be anything up to 15.1 metres, fewer luminaires are required. The combination of an energy-efficient lithium iron phosphate battery (LiFePO₄) with a long life time of eight years results in a high-quality product which, thanks to its clever mounting concept, also saves valuable time during installation.

---

**Efficient battery for optimized reliability**

The new lithium iron phosphate (LiFePO₄) battery gives the EM ready2apply luminaire a long lifetime of eight years, keeping maintenance costs at a minimum. The battery’s safety has been extensively tested by external independent specialists. The result is an extremely reliable solution, which allows an impressive three year battery guarantee. A unique push-click-connection with a snap in mechanism provides an integrated strain relief.

- Available as 1 cell or 2 cells variants
- Fully tested for safety with included temperature protection and monitoring
- Compact micro connector providing polarity safe connection
- 8 years design life and 3 year guarantee

---

**The right optics for any solution**

Every box contains three easily interchangeable optics, which equip EM ready2apply for **anti-panic** lighting, illuminating **escape routes** and to highlight **spots**.

- Maximum flexibility in every box
- Easily interchangeable with just a click
- Luminaire spacing up to 15.1 metres

---

**All variants**

- **BASIC**: tests have to be carried out manually and test results must be manually documented
- **SELFTEST**: tests carried out automatically and the results are documented manually
- **PRO**: test procedures and test sequences as well as the documentation of test results can be managed through a central DALI system.
LED driver and module in one
Flexible circuit technology has allowed Tridonic to integrate a complete solution into an extremely small housing. The complete assembly offers an ideal solution for a variety of ceiling constructions with void heights as small as 80 mm.

- Luminaire, battery and optics in a single box
- Small compact design for use in limited space
- Maintained and non-maintained variants
- Colour temperature: 6,500 K
- High colour rendering index: CRI > 80
- Narrow colour tolerance: MacAdam 3

Installation in just a few steps
Thanks to a clever installation concept, which even integrates the packaging as a useful installation guide, the EM ready2apply can be installed in just a few easy steps. The compact housing with the integrated driver allows for an aesthetic emergency solution even when space is limited.
Using the optics

The three interchangeable optics with click-in mechanism illuminate important objects and dangerous areas (spot), reduce stress and panic levels (anti-panic) and ensure that escape routes are clearly illuminated (escape route).

Spot distribution

Anti-Panic

Escape
**LED emergency lighting system**

**EM ready2apply surface-mounted luminaire**

Small luminaire, big responsibility

---

**Discreet design**

The lower variant of the rear panel blends seamlessly into its environment. Rear wiring makes the luminaire quick to mount.

**Flexible installation**

The higher variant of the rear panel is suitable for all types of wiring. Rear, side and through-wiring of the luminaire are all possible.

__Test variants:__

**BASIC**, tests have to be carried out manually and test results must be manually documented.

**SELFTEST**, tests carried out automatically and the results are documented manually.

**PRO**, test procedures and test sequences as well as the documentation of test results can be managed through a central DALI system.
When combined, the DALI-2-based sceneCOM lighting control unit and basicDIM Wireless control technology from Tridonic make the perfect intelligent lighting management team. Thanks to a targeted system extension, sceneCOM evo can now be used on wireless luminaires with an integrated basicDIM Wireless module, allowing existing systems to be expanded simply, quickly and cost-effectively.

**Application Controller sceneCOM evo DA2**
The Single Master Application Controller is certified according to the latest DALI-2 standard, making it compatible with all DALI-2 certified devices on the market. Software licence extensions enable the Application Controller to be extended with project-specific functions at low cost, thus offering even more flexibility when planning and implementing lighting solutions.

**basicDIM Wireless DALI Gateway**
The Gateway bridges the gap between wireless and DALI-based lighting control units. Luminaires with an integrated basicDIM Wireless radio module can therefore be easily integrated into and controlled from existing sceneCOM evo and S lighting management systems. They can also be integrated into building management systems via the sceneCOM evo and S Application Controllers. The combination of DALI and basicDIM Wireless thus helps create the ideal basis for straightforward refurbishment projects with significantly less installation work.

**Wireless Emergency System**
By combining sceneCOM evo and basicDIM Wireless, wireless safety luminaires can also be integrated into DALI systems and centrally monitored. The DALI Gateway handles the communication between the Application Controller and the basicDIM Wireless radio module in the luminaire. Additional DALI cables are therefore no longer required.
Automated emergency testing and reporting
Facilitate maintenance and centralised monitoring.
Reporting of functionality and duration testing and failures.
At a glance:

**sceneCOM Controller**

- Independent lighting control for up to 192 DALI devices on 3 DALI lines
- Simple configuration via WEB interface
- Comprehensive control of DALI circuit is possible
- Freely programmable daily planning with calendar function
- DALI emergency lighting test plan and monitoring (up to 50 emergency light devices)
- Corresponds to IEC 62034
- IP rating IP20
- For distribution board installation

**Interfaces**

- 3 DALI lines
- BACnet interface
- Terminals: Screw terminals

**Functions**

- Addressing wizard
- Presence linking
- Local and downloadable data backup
- Calendar
- Self-contained emergency luminaires
- Freely programmable shows
- RGB and Tunable White
