Digital dimmable ballasts for fluorescent lamps
ECO series

PCA TCL ECO lp xtec, 55 W
Compact and T5c fluorescent lamps

Product description
• Processor-controlled ballast with xtec inside
• Noise-free precise control via DSI signal, switchDIM or corridorFUNCTION
• CELMA energy class A1 BAT

Interfaces
• DSI
• switchDIM (with memory function + selectable dimming rate)
• corridorFUNCTION (3 preprogrammed profiles)
• Integrated SMART-Interface

Functions
• Intelligent Temperature Guard (protection against thermal damage)
• Intelligent Voltage Guard (overvoltage indication and undervoltage shutdown)
• Optimum filament heating in any dimmer setting
• Disconnection of filament heating from a dimming level of approx. 90 % for maximum energy efficiency (SMART-Heating Concept)
• Automatically triggered emergency lighting value in DC mode, 70 %
• For emergency lighting systems as per EN 50172
• Automatic start after replacement of defective lamps
• Backwards compatible

1) according to the EU directives on ecodesign requirements (EC) No. 245/2009 and (EC) No. 347/2010

Standards, page 2
Wiring diagrams and installation examples, page 5

Technical data
Power input on standby < 0.5 W
Protective hot restart 0.5 s for AC / 0.2 s for DC
Dimming range 1 – 100 %
Lamp start possible from 1 %
Operating frequency ~40 – 100 kHz
Life 50,000 h
Height 21 mm

Ordering data
Type Article number
For luminaires with 1 lamp
PCA 1x55 TCL ECO lp xtec 22176352
For luminaires with 2 lamps
PCA 2x55 TCL ECO lp xtec 22176353

Packaging 360 mm casing: 10 pieces/carton, 760 pieces/pallet
Packaging 425 mm casing: 10 pieces/carton, 640 pieces/pallet

Digital dimmable ballasts for fluorescent lamps
ECO series

Standards
EN 55015
EN 55022
EN 60065
EN 61000-3-2
EN 61347-2-3
EN 61547

Suitable for emergency installations according to EN 50172

Lamp starting characteristics
Warm start
Starting time 0.5s with AC
Starting time 0.2s with DC
Start at any dimming level

AC operation
Mains voltage
220–240 V 50/60 Hz
198–264 V 50/60 Hz including safety tolerance (±10%)
202–254 V 50/60 Hz including performance tolerance (+6% / -8%)

DC operation
220–240 V 0 Hz
198–280 V 0 Hz certain lamp start
176–280 V 0 Hz operating range
Use in emergency lighting installations according to EN 50172 or for emergency luminaires according to EN 61347-2-3 appendix J.

Light output level in DC operation
Default value is 70%.

Emergency units
The “PCA TCL ECO lp x tec” ballasts are compatible with all emergency units from Tridonic. See the table in the data sheet. Also all “5-pole” emergency units can be used. When used with other emergency units tests are necessary.

Temperature range
Unlimited dimming range from 10 °C to ta max.
-25 °C to +40 °C: dimming operation from 100 % to 30 %. If dim level goes below 30 % malfunction possible, but no electronic ballast damage. This applies to AC and DC operation.

Mains currents in DC operation (at 70 % light output)

<table>
<thead>
<tr>

<td>0.98</td>
</tr>
</tbody>
</table>

The ballast lumen factor for AC operation (AC-BLF) does not alter from Un = 198 VAC to Un = 254 VAC.
The ballast lumen factor for DC operation (DC-BLF) on the basis of an automatic power reduction of the ballasts (default value is 70 %) will be smaller than AC. It does not alter in the DC operating range (198–280 VDC).

Harmonic distortion in the mains supply (at 230 V / 50 Hz)

</tr>
</tbody>
</table>

The ballast lumen factor for AC operation (AC-BLF) does not alter from U n = 230 V to Un = 254 V.

The ballast lumen factor for DC operation (DC-BLF) on the basis of an automatic power reduction of the ballasts (default value is 70 %) will be smaller than AC. It does not alter in the DC operating range (198–280 VDC).
Dimming

Dimming curve is adapted to the eye sensitiveness.

- Dimming range 1 % to 100%
- Digital control with DSI signal:
  - 8 bit Manchester Code
  - Speed 1 % to 100 % in 1.4 s

Control input (D1, D2)

- Digital DSI signal, push-to-make switch (switchDIM) or a motion detector (corridorFUNCTION) can be wired on the same terminals (D1 and D2).
- Digital DSI signal
- The control input is non-polar and protected against accidental connection with a mains voltage up to 264 V. The control signal is not SELV. Control cable has to be installed in accordance to the requirements of low voltage installations.
- Different functions depending on each module.

SMART interface

An additional interface for the direct connection of the SMART-LS II lp 1) light sensor or corridorFUNCTION Plugs.

- Application and functionality see corridorFUNCTION user manual.
- SMART-LS II lp 1) light sensor operating mode:
  - The sensor registers actual ambient light and maintains the individually defined lux level.
  - After every mains reset the SMART interface automatically checks for an installed sensor.
  - After every mains reset the SMART interface automatically runs in the constant lux level mode.
- OFF/ON switch via mains, switchDIM or DSI signal.
- With switchDIM signals it is possible to change the controlled light level temporarily.

switchDIM

- Integrated switchDIM function allows a direct connection of a push to make switch for dimming and switching.

1) SMART-LS II lp: article number 86458258

---

Brief push (< 0.6 s) switches ballast ON and OFF. The ballasts switch-ON at light level set at switch-OFF. When the push to make switch is held, PCA ballasts are dimmed. After repush the PCA is dimmed in the opposite direction.

The switchDIM fade time is set to 3 s from min. to max. in the factory settings. With a 20 s push to the push to make switch this fade time can be changed to 6 s. In this instance the switchDIM application will be synchronized to 50 % light level after 10 s and after 20 s the light level rises to 100 % with the new fade time.

At every synchronization (10 s keystroke) the device will reset to 3 s (factory setting).

In installations with PCAs with different dimming levels or opposite dimming directions (e.g. after a system extension), all PCAs can be synchronized to 50 % dimming level by a 10 s push.

Use of push to make switch with indicator lamp is not permitted.

Deactivation: If the corridorFUNCTION is wrongly activated in a switchDIM system (for example a switch is used instead of pushbutton), there is the option of installing a pushbutton and deactivating the corridorFUNCTION mode by five short pushes of the button within three seconds.

switchDIM and corridorFUNCTION are very simple tools for controlling ballasts with conventional movement-action switches or motion sensors.

To ensure correct operation a sinusoidal mains voltage with a frequency of 50 Hz or 60 Hz is required at the control input.

Special attention must be paid to achieving clear zero crossings.

ECO series

Wiring advice
The lead length is dependent on the capacitance of the cable.

<table>

Intelligent Temperature Guard
The intelligent temperature guard protects the PCA TCL ECO lp xtec from thermal overheating by reducing the output power or switching off in case of operation above the thermal limits of the luminaire or ballast. Depending on the luminaire design, the ITG operates at about 5 to 10°C above Tc temperature.

Intelligent Voltage Guard
Intelligent Voltage Guard is the name of the new electronic monitor from Tridonic. This innovative feature of the PCA family of control gear from Tridonic immediately shows if the mains voltage rises above certain thresholds. Measures can then be taken quickly to prevent damage to the control gear.

• If the mains voltage rises above approx. 305 V (voltage depends on the ballast type), the lamp starts flashing on and off.
• This signal “demands” disconnection of the power supply to the lighting system.

Installation instructions
Wiring type and cross section
The wiring can be solid cable with a cross section of 0.5 to 0.75 mm² for push terminal and 0.5 mm² for IDC terminal. For the push-wire connection you have to strip the insulation (8–9 mm).

Wire preparation: 0.5 – 0.75 mm²

8 – 9 mm

Loosen wire through twisting and pulling

With standard solid wire 0.5/0.75 mm² the capacitance of the lead is 30–80 pF/m. This value is influenced by the way the wiring is made.
Lamp connection should be made with symmetrical wiring.
Hot leads (9, 10, 15, 16) and cold leads (11, 12, 13, 14) should be separated as much as possible.
When using two or more dimmable ballasts in one luminaire with separate dimming controls, the lamp leads must be kept separate.

Dimmable ballasts from Tridonic have to be earthed.

corridorFUNCTION
Activation: To activate the corridorFUNCTION a voltage of 230 V simply has to be applied for five minutes at D1, D2. The unit will then switch automatically to the corridorFUNCTION.
Deactivation: If the corridorFUNCTION is wrongly activated in a switchDIM system (for example a switch is used instead of pushbutton), there is the option of installing a pushbutton and deactivating the corridorFUNCTION mode by five short pushes of the button within three seconds.
The corridorFUNCTION V2 offers the added benefit of a second and third preprogrammed profile, which can be activated by the corridorFUNCTION plugs.
Application and functionality of profiles see user manual.

Intelligent Temperature Guard
The intelligent temperature guard protects the PCA TCL ECO lp xtec from thermal overheating by reducing the output power or switching off in case of operation above the thermal limits of the luminaire or ballast. Depending on the luminaire design, the ITG operates at about 5 to 10°C above Tc temperature.

Intelligent Voltage Guard
Intelligent Voltage Guard is the name of the new electronic monitor from Tridonic. This innovative feature of the PCA family of control gear from Tridonic immediately shows if the mains voltage rises above certain thresholds. Measures can then be taken quickly to prevent damage to the control gear.

• If the mains voltage rises above approx. 305 V (voltage depends on the ballast type), the lamp starts flashing on and off.
• This signal “demands” disconnection of the power supply to the lighting system.

Data sheet 02/12-878-2

Digital dimmable ballasts for fluorescent lamps
ECO series

RFI
- Connection to the lamps of the hot leads must be kept as short as possible
- Mains leads should be kept apart from lamp leads (ideally 5–10 cm distance)
- Do not run mains leads adjacent to the electronic ballast
- Twist the lamp leads
- Keep the distance of lamp leads from the metal work as large as possible
- Mains wiring to be twisted when through wiring
- Keep the mains leads inside the luminaire as short as possible

General advise
Electronic ballasts are virtually noise free. Magnetic fields generated during the ignition cycle can cause some background noise but only for a few milliseconds.

For further technical information please visit www.tridonic.com

Operation on DC voltage
Our ballasts are construed to operate DC voltage and pulsed DC voltage.
To operate ballasts with pulsed DC voltage the polarity is absolute mandatory.

Isolation and electric strength testing of luminaires
Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an isolation test with 500 Vdc for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal. The isolation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 Vac (or 1.414 x 1500 Vdc). To avoid damage to the electronic devices this test must not be conducted.

Dimmable ballasts from Tridonic have to be earthed.

For further technical information please visit www.tridonic.com
