Product description

- For metal halide lamps
- Also for mobile luminaires with connectors
- Pulse packets for increased ignition energy (pulseCONTROL technology)
- With patented circuit elements
- Halogen-free lamp cable with ST18 socket and interlock lug
- Flicker-free light
- Colour stability thanks to constant power
- Guaranteed long life
- No acoustic resonance
- Safety shutdown if a lamp is faulty or missing
- Greatly reduced reignition time
- Hardly any EMC interference in the ignition phase
- Automatic shutdown on overheating
- Through wiring possible
- No tools required for installing the terminal cover and cable clamps
- Push-in terminals up to 2.5 mm²
- 3 separate strain reliefs
- Casing: polycarbonate, black

Technical data

Mains voltage range 220 – 240 V
AC voltage range 198 – 254 V
DC voltage range 0/50/60 Hz
Max. ignition voltage 5 kVp (7 kVp at 22 W)
Operating frequency 145 Hz
Type of protection IP20

Ordering data

Type Article number Packing, carton Packing, pallet Weight per pcs.

For luminaires with 1 lamp
PCI 20 PRO C521 ST 86459019 12 pieces 288 pieces 0.30 kg

1) At tc = 25 °C.
Installation instructions

Wiring type and cross section
Stranded wire or solid wire up to 2.5 mm² may be used for wiring. Strip 10–11 mm of insulation from the cables to ensure perfect operation of the screw terminals.

Use one wire for each terminal connector only.

Use each strain relief channel for one cable only.

Lamp cable connector
Black ST-18 socket

Terminals
Screw type M3
Torque 0.5 Nm

Fixing conditions
Dry, acidfree, oilfree, fatfree. The maximum ambient temperature must not be exceeded. Is not suitable for fixing in corners.
Whenever possible keep the ballast away from hot parts. It helps increasing the lifetime of the ballast.

If several ballasts are installed in masts, boxes, etc., measures must be taken to avoid overheating of individual components.
To prevent the use of a wrong lamp type we recommend to mark the luminaire with the correct lamp type that fits to the ballast.

Note on wiring
The length of the lamp wires is limited by the value of cable capacitance. The maximum of 160/400 pF would enable connection of approximately 2/5 metres of lamp wire.

In class 1 luminaires it is necessary to earth the ballast and the luminaire, in class 2 luminaires not.

Warning – starting voltage up to max. 5 kV!
Not suitable for use with lamps with integral ignitors.
A list of released lamps for the save operation with PCI can be found on www.tridonic.com ➔ Technical Data ➔ Lamp matrix ➔ Lamp Matrix for HID

Safety switch off
End of life of the lamps
At the end of their useful life, lamps often cycle on/off. The PCI ballast recognizes this condition and switches off the lamp, after three complete on/off cycles and whilst the supply has been unswitched. Complete lamp switch off enables easy identification of a defective lamp in the application. After a change of the faulty lamp and an interruption of the mains supply (mains reset) the ballast will strike the lamp. When there is no lamp in circuit or a defective lamp is connected to the ballast, the ballast will switch off after apr. 25 minutes.

Overtemperature shutdown
The units shut down at ΔT approx. +12 °C compared with tc/ta. A mains reset must be carried out so that the units switch on again.

Overload strength
320 Vac/ h
280 Vdc/10 h

Standards

Temperature range

The ta temperature value is the basis for specifying the rated life. The relationship between the tc temperature and the ta temperature depends on the design of the luminaire. If the measured tc temperature is approximately 5 K under the tc max. temperature the ta temperature should be checked and, if necessary, measurements should be taken on the critical components (e.g. electrolytic capacitor).

Detailed information is available on request.

The temperature range is specified for an average life of 50,000 hours under rated conditions, with a failure probability of less than 10%. This corresponds to an average failure rate of 0.2% per 1,000 hours of operation.

The specified tc temperature is the maximum permitted value (rated temperature according to EN 61347-1). Above this safety-related value the thermal cutout protects the device against damage. The expected lifetime values are shown in the following table. The tc values are the relevant values here.

Isolation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative) or ENEC 303-Annex A, each luminaire should be submitted to an isolation test with 500 V or for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal. The isolation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V (or 1.414 x 1500 V). To avoid damage to the electronic devices this test must not be conducted.

Storage conditions

Humidity: 5% up to max. 85%, not condensed (max. 56 days/year at 85%)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be within the specified temperature range (ta) before they can be operated.
