Product description
- For metal halide lamps
- Also for mobile luminaires with connectors
- Pulse packets for increased ignition energy (pulseCONTROL technology)
- Switching possible via mains or powerless via the digital interface
- Noise-free precise control via DALI or DSI signal
- On/Off switching via DALI/DSI signal
- Fault reporting in DALI mode
- With patented circuit elements
- Flicker-free light
- Colour stability thanks to constant power
- Guaranteed long life
- No acoustic resonance
- Safety shutdown if a lamp is faulty or missing
- Greatly reduced reignition time
- Hardly any EMC interference in the ignition phase
- Automatic shutdown on overheating
- Screw terminals: ≤ 1.5 mm² for stranded wire, ≤ 2.5 mm² for solid wire
- Lower section of casing made of steel
- Upper section of casing made of Makrolon, V0 material, black

Technical data
- Mains voltage range: 220 – 240 V
- AC voltage range: 180 – 234 V
- DC voltage range: 153 – 320 V
- Mains frequency: 50 / 60 Hz
- Max. ignition voltage: 5 kV
- Operating frequency: 145 Hz
- Type of protection: IP20

Installation instructions

Wiring type and cross section
Stranded wire with end ferrule with a cross section of 1.5 mm² or solid wire up to 2.5 mm² may be used for wiring. Strip 6 mm of insulation from the cables to ensure perfect operation of the screw terminals.

Mounting recommendation
To ensure optimum heat removal the ECG should be mounted on a metal plate (luminaire body). No insulators between the ECG and the the cooling surface (air, adhesive tape, etc.). Finally, the temperature measurement remains important.

Radio interference
- Do not cross mains and lamp cables.
- Do not lay mains cables together with lamp cables (ideally they should be 5–10 cm apart).
- Do not lead mains cables too closely along the electronic ballast.
- Twist lamp cables.
- Increase the distance between lamp cables and earthed metal surfaces.
- Keep the mains cable in the luminaire short.
- Parallel runs (x) of mains and lamp cables must be kept as short as possible.

Important advise
When a lamp is changed (at the end of its life), if a lamp is missing, or after overtemperature shutdown the mains voltage of the ECG must be disconnected.

Warning – starting voltage up to max. 5 kV!
Not suitable for use with lamps with integral ignitors.

Note on wiring
The length of the lamp wires is limited by the value of cable capacitance. The maximum of 120 pF would enable connection of approximately 1.5 metres of lamp wire.

In class 1 luminaires it is necessary to earth the ballast and the luminaire via the earth terminal.

Protection class 2 luminaires do not need an earth connection. Insulation must be provided by the luminaire design.

To avoid the damage of the control gear, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.).

Standards

Safety switch off
End of life of the lamps
At the end of their useful life, lamps often cycle on/off. The PCI ballast recognises this condition and switches off the lamp, after three complete on/off cycles and whilst the supply has been unswitched. Complete lamp switch-off enables easy identification of a defective lamp in the application. After a change of the faulty lamp and an interruption of the mains supply (mains reset) the ballast will strike the lamp. When there is no lamp in circuit or a defective lamp is connected to the ballast, the ballast will switch off after apr. 25 minutes.

Overtemperature shutdown
The ballasts switch off at an overtemperature of around 10 °C. They can be restored with an OFF-ON sequence via DALI/DSI or with a mains reset.

Overload strength
320 VAC/1 h
Installation instructions

Control input (DA)
Digital DALI/DSI signal can be wired on the terminals DA.

Digital signal DALI/DSI
The control input is non-polar and protected against accidental connection with a mains voltage up to 264 V. The control signal is not SELV. Control cable should be installed in accordance with the requirements of low voltage installations. Different functions depending on each module.

Standards (DALI)
DALI standard IEC 62368
HID EVG → device type 2
DALI 0 = 0 % light
DALI > 0 = 100 % light

Programmable parameters
• Groups 1–16
• Scenes 1–16 (values 0 % / 100 % / MASK)
• Power On Level (values 0 % / 100 %)
• System Failure Level (values 0 % / 100 %)

Queries
via DALI standard:
• Lamp wattage (values yes/no)
• Lamp error (values yes/no)

via eDALI:
• Lamp type
• Device type
• Article number
• Production date
• Serial number
• Software version
• Commissioning

OEM Memory Bank
The customer can store additional luminaire information in the ECG (Memory Bank 1), such as luminaire type and article number. Data is written to Memory Bank 1 in accordance with DALI standard IEC 62368.

Commissioning of PCI FOX ballasts

Because of the special characteristics of HID light sources, PCI FOX ballasts (Device Type 2) cannot be addressed in the same way as conventional DALI ballasts for fluorescent or halogen lamps for example. For visualisation during the grouping phase the HID lamps must remain switched off before and during the addressing phase as they can only be properly ignited in the cold state. Dimmed operation of these lamps is not recommended, which also calls for different handling during commissioning.

Tridonic recommends configTOOL ≥ V1.5 software for commissioning PCI FOX ballasts (download from www.tridonic.com → Services → Download → Software).

IMPORTANT: Other DALI controllers can only be used for commissioning if they handle DALI Device Type 2 units appropriately (see Requirements of control products).

Overview – commissioning cycle with configTOOL ≥ V1.5

www.tridonic.com
Step-by-step commissioning with configTOOL ≥ V1.5

1. Cooling phase
HID EVG → Device Type 2
The lighting must have been switched off before start-up for at least 10 min.
(visualization/grouping is not possible with hot lamps)

2. Initialisation and addressing phase
• Launch DALI configTOOL and select the DALI interface
• Go to the “DALI Device Programmer” tab
• Click on “Search Devices” and follow the on-screen instructions.

PCI FOX devices remain dark during the entire addressing phase. In contrast, DALI devices for fluorescent lamps, LEDs and incandescent lamps fade down to their minimum value and go to 100% during the addressing phase. At the end of the addressing phase they fade back to their minimum value.

3. Visualisation in the grouping phase
• Activate the “Enable optical selection feedback” by ticking the checkbox
• If a PCI FOX device (Device Type 2, special symbol) is selected in configTOOL the appropriate device switches on. It remains on until a different DALI device is selected in the system.
→ PCI FOX then switches off after a maximum delay of 10 seconds.

4. Operation
• PCI FOX devices can be switched powerless with a broadcast signal (DALI or DSI, without addressing of the devices)
• PCI FOX devices can be addressed and operated individually or in groups with a DALI signal. For examples with Tridonic controls please see matrix above.

Requirements of control products

| Initiation/addressing phase: | | |
| --- | --- | |
| INITIALIZE | (This command must be sent first) | |
| ... | | |
| ... | | |
| RECALL MIN LEVEL | | |
| ... | | |
| ... | | |
| TERMINATE | (Last command in the initialisation phase) | |
| | | |
| When the INITIALIZE command is sent, PCI FOX devices change the RECALL MIN value to 0% → devices switch off/remain switched off | | |
| When the TERMINATE command is sent, PCI FOX changes the RECALL MIN value back to 1% (100% light) | | |
