Product description

• Pulse packets for increased ignition energy (pulseCONTROL technology)
• Flicker-free light
• Colour stability thanks to constant power
• No acoustic resonance
• Safety shutdown if a lamp is faulty or missing
• Greatly reduced reignition time
• Hardly any EMC interference in the ignition phase
• Screw terminals: ≤ 1.5 mm² for stranded wire, ≤ 2.5 mm² for solid wire
• Dimming via digital interface
• Noise-free precise control via DALI, DSI or stepDIM
• Fault reporting in DALI mode
• Unit fully encased to protect against dust, moisture and vibration
• Enhanced protection against mains transients
• Enhanced insulation
• Casing: polycarbonate, black
• 5-year guarantee

HID control gear
Electronic

Technical data
- Mains voltage range: 220 – 240 V
- AC voltage range: 198 – 254 V
- Mains frequency: 50 / 60 Hz
- λ at 50 Hz: 230 V 0.97
- Max. ignition voltage PCI, PCIS: 5 kVp
- Max. ignition voltage PCS: 2.5 kVp
- Operating frequency: 145 Hz
- Type of protection: IP20
- Dimensions L x W x H: 150 x 90 x 40 mm

At ta = 25 °C.
Installation instructions

Wiring type and cross section
Stranded wire with end ferrule with a cross section of 1.5 mm² or solid wire up to 2.5 mm² may be used for wiring. Strip 6 mm of insulation from the cables to ensure perfect operation of the screw terminals.

wire preparation: 0.5 – 2.5 mm²

Note on wiring
The length of the lamp wires is limited by the value of cable capacitance. The maximum of 400 pF would enable connection of approximately 5 metres of lamp wire.

To avoid the damage of the control gear, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.).

In class 1 luminaires it is necessary to earth the ballast and the luminaire via the earth terminal.

Protection class 2 luminaires do not need an earth connection. Insulation must be provided by the luminaire design.

Radio interference
- Do not cross mains and lamp cables.
- Do not lay mains cables together with lamp cables (ideally they should be 5–10 cm apart).
- Do not lead mains cables too closely along the electronic ballast.
- Twist lamp cables.
- Increase the distance between lamp cables and earthed metal surfaces.
- Keep the mains cable in the luminaire short.
- Parallel runs (x) of mains and lamp cables must be kept as short as possible.

Mounting recommendation
To ensure optimum heat removal the ECG should be mounted on a metal plate (luminaire body). No insulators between the ECG and the cooling surface (air, adhesive tape, etc.). Finally, the temperature measurement remains important.

Safety switch off
End of life of the lamps
At the end of their useful life, lamps often cycle on/off. The PCIS ballast recognises this condition and switches off the lamp, after three complete on/off cycles and whilst the supply has been unswitched. Complete lamp switch-off enables easy identification of a defective lamp in the application. After a change of the faulty lamp and an interruption of the mains supply (mains reset) or send a ON-OFF sequence the ballast will strike the lamp. When there is no lamp in circuit or a defective lamp is connected to the ballast, the ballast will switch off after approx. 25 minutes.

Overtemperature shutdown
The ballasts are equipped with a thermal shutdown to protect against destruction. After shutdown they can be restored with an OFF-ON sequence via DALI/DSI or with a mains reset.

Overload strength
320 VAC/1 h

Important advise
When a lamp is changed (at the end of its life), if a lamp is missing, or after overtemperature shutdown the mains voltage of the ECG must be disconnected. Alternatively an OFF ON sequence can be sent.

Warning – starting voltage up to max. 5 kV!
Not suitable for use with lamps with integral ignitors.
A list of released lamps for the save operation with PCIS can be found on www.tridonic.com → Techn. Data → Lamp matrix → Lamp Matrix for HID

Transient protection

according to EN 61000-4-5. Protected against a single 10 kV pulse.
Dimming of HID lamps
Using PCIS ballasts HID lamps can be dimmed down up to 40% light output.
In principle all sodium lamps can be dimmed down to 40%. Due to the lamp characteristics of metal halide lamps only selected lamps are released for dimming. The minimum dim level of PCI 45/60/90/140 outdoor DIM chronoSTEP is set according to the lamp specification.
If lamps are operated below their specified minimum dim level, performance and lifetime can be declined.
After starting up the PCIS stepDIM the connected lamp needs to be burned in for the first 19 minutes in operation. A power reduction within these 19 minutes is not possible.
After the burn in phase, when leaving the interface open the ballasts stay on 100% light output. At a dimming level of 40% the light output can vary due to the lamp characteristics between 20 and 45%.
A list of released lamps for the safe operation with PCIS can be found on www.tridonic.com → Technology → Lamp matrix → Lamp Matrix for HID

Dimming via DALI/DSI
Via DALI/DSI the lamp can be dimmed between the pre-adjusted minimum and DALI 222/255 (100%). Using DALI/DSI levels between 1 and the pre-adjusted minimum dim level the light output is the minimum dim level.

Control via DALI/DSI
Control input (DA)
Digital DALI/DSI signal can be wired on the terminals DA.

Different functions depending on each module.

Standards (DALI)
HID EVG → device type 2
DALI 0 = 0% light
DALI 1 ... 222 = 40% light

Programmable parameters
• Groups 1–16
• Scenes 1–16 (values 0% / 40% ... 100% / MASK)
• Power On Level (values 0% / 40% ... 100%)
• System Failure Level (values 0% / 40% ... 100%)

Queries
via DALI standard:
• Lamp wattage (value yes/no)
• Lamp error (value yes/no)

via Tridonic master CONFIGURATOR:
• Lamp type
• Device type
• Article number
• Production date
• Serial number
• Software version
• Commissioning

OEM Memory Bank
The customer can store additional luminaire information in the ECG (Memory Bank 1), such as luminaire type and article number. Data is written to Memory Bank 1 in accordance with DALI standard IEC 62368.
Commissioning of PCIS outdoor DIM ballasts

Because of the special characteristics of HID light sources, PCIS outdoor DIM ballasts (Device Type 2) cannot be addressed in the same way as conventional DALI ballasts for fluorescent or halogen lamps for example. For visualisation during the grouping phase the HID lamps must remain switched off before and during the addressing phase as they can only be properly ignited in the cold state. Dimmed operation of these lamps is not recommended, which also calls for different handling during commissioning.

Tridonic recommends masterCONFIGURATOR ≥ V2.0.0 software for commissioning PCIS outdoor DIM ballasts (download from www.tridonic.com → Services → Software).

IMPORTANT: Other DALI controllers can only be used for commissioning if they handle DALI Device Type 2 units appropriately (see Requirements of control products).

Requirements of control products

Initialization/addressing phase:

**INITIALIZE**

---

**RECALL MIN LEVEL**

---

**TERMINATE**

(This command must be sent first)

When the INITIALIZE command is sent, PCIS outdoor DIM devices change the RECALL MIN value to 0 % → devices switch off/remain switched off (last command in the initialization phase)

When the TERMINATE command is sent, PCIS outdoor DIM changes the RECALL MIN value back to 40 % (100% light)

The high ignition voltage of high pressure lamps can lead to interferences. During the ignition time the communication can be disturbed. Therefore the ballast might not react during the ignition phase. This has to be considered especially when using gateways.

Realisation with Tridonic controls

Step-by-step commissioning with masterCONFIGURATOR ≥ V2.0.0

1. Cooling phase

HID EVG → Device Type 2

The lighting must have been switched off before start-up for at least 10 min. (visualisation/grouping is not possible with hot lamps)

2. Initialisation and addressing phase

- Launch DALI masterCONFIGURATOR
- Click on “Addressing wizard” and follow the on-screen instructions.

PCIS outdoor DIM devices remain dark during the entire addressing phase. In contrast, DALI devices for fluorescent lamps, LEDs and incandescent lamps fade down to their minimum value and go to 100 % during the addressing phase. At the end of the addressing phase they fade back to their minimum value.

3. Visualisation in the grouping phase

- Activate the “Enable optical selection feedback” by ticking the checkbox.
- If a PCIS outdoor DIM device (Device Type 2, special symbol) is selected in masterCONFIGURATOR the appropriate device switches on. It remains on until a different DALI device is selected in the system. → PCIS outdoor DIM then switches off after a maximum delay of 10 seconds.

4. Operation

- PCIS outdoor DIM devices can be switched powerless with a broadcast signal (DALI or DSI, without addressing of the devices)
- PCIS outdoor DIM devices can be addressed and operated individually or in groups with a DALI signal. For examples with Tridonic controls please see matrix above.

Overview – commissioning cycle with masterCONFIGURATOR ≥ V2.0.0

Commissioning comparison table

</tr>
</tbody>
</table>

Before commissioning the installation

- Device must have been switched off for at least 10 minutes!

Initialisation and addressing phase

- Devices remain switched off
- Devices fade to minimum value
- On successful addressing the devices fade up to 100 %
- At the end of the addressing phase the devices fade down to the minimum value

Visualization in the grouping phase

- Selected device starts the lamp at 100 %
- If a different device is selected the previously selected device switches off with a maximum delay of 10 s
- Selected device fades from minimum value to 100 %
- If a different device is selected the previously selected device fades to the minimum value

Visualization/grouping is not possible with hot HID lamps!

Operation

- Devices can be controlled/operated with other DALI/DSI control products
- Devices can be controlled/operated with other DALI/DSI control products

www.tridonic.com
chronoSTEP function
In the outdoor lighting and street lighting sector, it often makes sense to dim the lighting level during night hours in order to save energy. The chronoSTEP function is a tool that makes this easy to do. The device automatically measures the switch-on and switch-off times of the lighting installation over the past three days. The switch-on and switch-off times are typically the times at which the sun sets and rises. The midpoint of these two reference points is the time referred to as Virtual Midnight. The overall time interval between switch-on and switch-off points is called On Time.

Notice
When calculating the On-Time, only values between 2 and 24 hours are counted. Values less than 2 hours could indicate a power failure and are therefore not saved. For settings longer than 24 hours, 24 hours is saved as the maximum possible value.

Two different output profiles are used to adjust the function settings. These profiles define which parameters can be adjusted.

Profile 1: Setting Time 1 and Time 2
Two time intervals can be defined using Profile 1 (formerly U6M): Time 1 defines how many hours before Virtual Midnight the lighting is dimmed to a lower level; Time 2 defines how many hours after Virtual Midnight the dimming level is raised again.
The two dimming levels are preset to fixed percentage values that cannot be modified.

Profile 2: Setting Time 1, 2, 3, and 4 and Dimming level 1, 2 and 3
Profile 2 can be used to define four time intervals and three dimming levels. The combination of values allows more precise control of the dimming level at different times before and after Virtual Midnight.

Programming
With appropriate software and a USB interface different functions can be activated and various parameters can be configured in the PCI outdoor DIM. All that is needed is a DALI-USB and the software (masterCONFIGURATOR).

masterCONFIGURATOR
For programming the device configuration and for resetting.

For further information of the programming use the product manual please visit www.tridonic.com
Temperature range

The ta temperature value is the basis for specifying the rated life. The relationship between the tc temperature and the ta temperature depends on the design of the luminaire.

PCIS outdoor chronoSTEP is designed for an average life of 60,000 hours under rated conditions, with a failure probability of less than 10%. This corresponds to an average failure rate of 0.2% per 1,000 hours of operation.

The specified tc temperature is the maximum permitted value (rated temperature according to EN 61347 -1). Above this safety-related value the thermal cutout protects the device against damage.

The expected life-time values are shown in the following table. The tc values are the relevant values here.

Storage conditions

Humidity: 5% up to max. 85%, not condensed (max. 56 days/year at 85%)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be within the specified temperature range (ta) before they can be operated.

Isolation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an isolation test with 500 V DC for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal.

The isolation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V AC (or 1.414 x 1500 V DC). To avoid damage to the electronic devices this test must not be conducted.
