Product description

- Pulse packets for increased ignition energy (pulseCONTROL technology)
- Flicker-free light
- Colour stability thanks to constant power
- No acoustic resonance
- Safety shutdown if a lamp is faulty or missing
- Greatly reduced reignition time
- Hardly any EMC interference in the ignition phase
- Screw terminals: ≤1.5 mm² for stranded wire, ≤2.5 mm² for solid wire
- Switching possible via mains or powerless via the digital interface
- Noise-free precise control via DALI or DSI signal
- Fault reporting in DALI mode
- Enhanced protection against mains transients
- Enhanced insulation
- Unit fully encased to protect against dust, moisture and vibration
- Casing: polycarbonate, black

Technical data

Mains voltage range 220 – 240 V
AC voltage range 198 – 254 V
Mains frequency 50 / 60 Hz
λ at 50 Hz 230 V 0.97
Max. Ignition voltage PCI, PCIS 5 kVp
Max. Ignition voltage PCS 2.5 kVp
Operating frequency 145 Hz
Type of protection IP20
Dimensions L x W x H 150 x 90 x 40 mm

At tc = 25 °C.
Installation instructions

Wiring type and cross section
Stranded wire with end ferrule with a cross section of 1.5 mm² or solid wire up to 2.5 mm² may be used for wiring. Strip 6 mm of insulation from the cables to ensure perfect operation of the screw terminals.

Radio interference
- Do not cross mains and lamp cables.
- Do not lay mains cables together with lamp cables (ideally they should be 5 – 10 cm apart).
- Do not lead mains cables too closely along the electronic ballast.
- Twist lamp cables.
- Increase the distance between lamp cables and earthed metal surfaces.
- Keep the mains cable in the luminaire short.
- Parallel runs (x) of mains and lamp cables must be kept as short as possible.

Mounting recommendation
To ensure optimum heat removal the ECG should be mounted on a metal plate (luminaire body). No insulators between the ECG and the the cooling surface (air, adhesive tape, etc.). Finally, the temperature measurement remains important.

Safety switch off
End of life of the lamps
At the end of their useful life, lamps often cycle on/off. The PCS ballast recognises this condition and switches off the lamp, after three complete on/off cycles and whilst the supply has been unswitched. Complete lamp switch-off enables easy identification of a defective lamp in the application. After a change of the faulty lamp and an interruption of the mains supply (mains reset) or send a ON-OFF sequence the ballast will strike the lamp. When there is no lamp in circuit or a defective lamp is connected to the ballast, the ballast will switch off after approx. 25 minutes.

Overtemperature shutdown
The ballasts are equipped with a thermal shutdown to protect against destruction. After shutdown they can be restored with an OFF-ON sequence via DALI/DSI or with a mains reset.

Overload strength
320 VAC/1 h

Important advice
When a lamp is changed (at the end of its life), if a lamp is missing, or after overtemperature shutdown the mains voltage of the ECG must be disconnected. Alternatively an OFF ON sequence can be sent.

Warning – starting voltage up to max. 5 kV
Not suitable for use with lamps with integral igniters.
A list of released lamps for the save operation with PCS can be found on www.tridonic.com → Technical Data → Lamp matrix → Lamp Matrix for HID

according to EN 61000-4-5. Protected against a single 10 kV pulse.

Note on wiring
The length of the lamp wires is limited by the value of cable capacitance. The maximum of 400 pF would enable connection of approximately 5 metres of lamp wire.

To avoid the damage of the control gear, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.).

In class 1 luminaires it is necessary to earth the ballast and the luminaire via the earth terminal.

Protection class 2 luminaires do not need an earth connection. Insulation must be provided by the luminaire design.

Control via DALI/DSI

Control input (DA)
Digital DALI/DSI signal can be wired on the terminals DA.

Digital signal DALI/DSI
The control input is non-polar and protected against accidental connection with a mains voltage up to 264 V. The control signal is not SELV. Control cable should be installed in accordance with the requirements of low voltage installations. Different functions depending on each module.

Standards (DALI)
HID EVG → device type 2
Switching device → device type 7
DALI 0 = 0 % light
DALI > 0 = 100 % light

Programmable parameters
- Groups 1–16
- Scenes 1–16 (values 0 % / 100 % / MASK)
- Power On Level (values 0 % / 100 %)
- System Failure Level (values 0 % / 100 %)

Queries
via DALI standard:
- Lamp wattage (values yes/no)
- Lamp error (values yes/no)

via Tridonic masterCONFIGURATOR:
- Lamp type
- Device type
- Article number
- Production date
- Serial number
- Software version
- Commissioning

OEM Memory Bank
The customer can store additional luminaire information in the ECO (Memory Bank 1), such as luminaire type and article number. Data is written to Memory Bank 1 in accordance with DALI standard IEC 62368.

Commissioning of PCS outdoor FOX ballasts
Because of the special characteristics of HID light sources, PCS outdoor FOX ballasts cannot be addressed in the same way as conventional DALI ballasts for fluorescent or halogen lamps for example. For visualisation during the grouping phase the HID lamps must remain switched off before and during the addressing phase as they can only be properly ignited in the cold state. Dimmed operation of these lamps is not recommended, which also calls for different handling during commissioning.

Tridonic recommends masterCONFIGURATOR ≥ V2.0.0 software for commissioning PCS outdoor FOX ballasts (download from www.tridonic.com → Services → Software).

IMPORTANT: Other DALI controllers can only be used for commissioning if they handle DALI Device Type 2 units appropriately (see Requirements of control products).

Requirements of control products
Initialization/addressing phase:

**INITIALIZE**

... 

... 

**RECALL MIN LEVEL**

... 

... 

**TERMINATE**

... 

(The command must be sent first)
When the INITIALIZE command is sent, PCS outdoor DIM devices change the RECALL MIN value to 0 % → devices switch off/remain switched off (last command in the initialization phase)
When the TERMINATE command is sent, PCS outdoor DIM changes the RECALL MIN value back to 40 % (100 % light)

The high ignition voltage of high pressure lamps can lead to interferences. During the ignition time the communication can be disturbed. Therefore the ballast might not react during the ignition phase. This has to be considered especially when using gateways.

2. Initialisation and addressing phase

- Launch masterCONFIGURATOR
- Click on “Addressing wizard” and follow the on-screen instructions.

PCS outdoor FOX devices remain dark during the entire addressing phase. In contrast, DALI devices for fluorescent lamps, LEDs and incandescent lamps fade down to their minimum value and go to 100% during the addressing phase. At the end of the addressing phase they fade back to their minimum value.

3. Visualisation in the grouping phase

- Activate the “Enable optical selection feedback” by ticking the checkbox.
- If a PCIS outdoor FOX device (Device Type 2, special symbol) is selected in configTOOL the appropriate device switches on. It remains on until a different DALI device is selected in the system. → PCIS outdoor FOX then switches off after a maximum delay of 10 seconds.

4. Operation

- PCIS outdoor FOX devices can be switched powerless with a broadcast signal (DALI or DSI, without addressing of the devices)
- PCIS outdoor FOX devices can be addressed and operated individually or in groups with a DALI signal. For examples with Tridonic controls please see matrix above.

Storage conditions

Humidity: 5% up to max. 85%, not condensed
(max. 56 days/year at 85%)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be within the specified temperature range (ta) before they can be operated.

Isolation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only) or ENEC 303-Annex A, each luminaire should be submitted to an isolation test with 500 V~ for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal. The isolation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V~ (or 1.414 x 1500 V~). To avoid damage to the electronic devices this test must not be conducted.
Temperature range

The ta temperature value is the basis for specifying the rated life. The relationship between the tc temperature and the ta temperature depends on the design of the luminaire.

PCIS outdoor B011 is designed for an average life of 60,000 hours under rated conditions, with a failure probability of less than 10%. This corresponds to an average failure rate of 0.2% per 1,000 hours of operation.

The specified tc temperature is the maximum permitted value (rated temperature according to EN 61347-1). Above this safety-related value the thermal cutout protects the device against damage.

The expected life-time values are shown in the following table. The tc values are the relevant values here.
