Product description
- LED emergency lighting module
- Anti-panic emergency lighting: illuminance $E \geq 0.5$ lux (as per EN 1838)
- Compatible with EM powerLED 1 W

Properties
- High-power LED in chip-on-board technology (COB)
- Long life thanks to integrated heat removal
- Optimised system efficacy with broad beam characteristic
- Integrated bi-colour status LED
- Reverse polarity protection
- Small dimensions
- Different installation options
- Connection: cable 300 mm

Standards, page 3
Colour temperatures and tolerances, page 4
Wiring diagrams and installation examples, page 4
Module EM-AP 004
EM LED compact

Technical data
- Colour rendering index CRI > 70
- Ambient temperature range: -25 °C to +50 °C
- tp rated: 45 °C
- tc² up to 85 °C
- Max. DC forward current: 700 mA
- Max. permissible LF current ripple: 960 mA
- Max. permissible peak current: 1920 mA / max. 10 ms
- Max. permissible output voltage of LED Driver: 50 V
- Insulation test voltage: 1.1 kV

Additional notes:
1. Data for operation with 350 mA.
2. If the max. temperature limits are exceeded, the life of the module will be reduced or the module may be damaged.
3. The temperature of the LED module at the tc-point is to be measured in the thermally stable state. For tc-point see the above diagram.
4. Exceeding the max. operating current leads to an overload on the LED module. This may in turn result in a significant reduction in life time or even destruction of the LED module.
5. Tolerance range for optical data: ±10 %.
6. Tolerance range for electrical data: ±5 %.
7. Colour temperature and colour rendering index CRI according to CIE 1931.
8. All values at tp = 45 °C.
9. EM = Emergency.

Light distribution

tc point, ambient temperature and life-time
The temperature at tc reference point is crucial for the light output and life-time of a LED product.

Compliance with the maximum permissible reference temperature at the tc point must be checked under operating conditions in a thermally stable state. The maximum value must be determined under worst-case conditions for the relevant application.

Storage and humidity

| Storage Temperature | -30°C to +80°C |

Operation only in non-condensing environment.
Humidity during processing of the module should be between 30% to 70%.

Mounting

Surface mounting:

Recessed mounting:

Glow-wire test according to EN 62031 with increased temperature of 850 °C passed.

Electrical supply/choice of converter

EM-AP 004 modules from Tridonic are not protected against overvoltages, overcurrents, overloads or short-circuit currents. Safe and reliable operation can only be guaranteed in conjunction with a converter which complies with the relevant standards. The use of EM powerLED converters from Tridonic in combination with EM-AP 004 modules guarantees the necessary protection for safe and reliable operation.

If a converter other than Tridonic EM powerLED converter is used, it must provide the following protection:

- SELV
- Short-circuit protection
- Overload protection
- Overtemperature protection

The EM-AP 004 module must be supplied by a constant current converter. Operation with a constant voltage converter will lead to an irreversible damage of the module. The EM-AP 004 modules is protected against reversed polarity.

Chemical substance may harm the LED module. Chemical reactions could lead to colour shift, reduced luminous flux or a total failure of the module caused by corrosion of electrical connections.

Materials which are used in LED applications (e.g. sealings, adhesives) must not produce dissolver gas. They must not be condensation curing based, acetate curing based or contain sulfur, chlorine or phthalate.

Avoid corrosive atmosphere during usage and storage.

EOS/ESD safety guidelines

The device / module contains components that are sensitive to electrostatic discharge and may only be installed in the factory and on site if appropriate. EOS/ESD protection measures have been taken. No special measures need be taken for devices/modules with enclosed casings (contact with the pc board not possible), just normal installation practice. Please note the requirements set out in the document EOS / ESD guidelines (Guideline_EOS_ESD.pdf) at: http://www.tridonic.com/esd-protection

Coordinates and tolerances according to CIE 1964

The specified colour coordinates are measured by a current impulse of 350 mA and a duration of 200 ms. The ambient temperature of the measurement is ta = 25 °C. The measurement tolerance of the colour coordinates are ± 0.01.

Notes

The wiring acc. to the information above is valid for the usage in conjunction with EM powerLED ST and EM powerLED PRO. When the EM-AP 004 is used with the EM powerLED BASIC the polarity of the indicator LED has to be changed. Connect the orange lead to the terminal "P" and the pink lead to the terminal "O".

When two EM-AP modules are used with an EM powerLED 2W converter module only one indicator LED can be connected to the driver.

When the EM-AP 004 is used in mains operation a separate indication LED must be used.

Note:
The indication LED is part of the EM-AP module.
